# Asbestos Cement Shingles

AND

# Asbestos Building Lumber

**T**HE great invention of a unique process for the practical production of a new fireproof building material, which invention has been patented in many countries and which material is so well known throughout all civilization, composed as it is entirely of Asbestos fibre and hydraulic or Portland cement, marks an epoch in the building industry, and a new birth in the matter of fire protection, so far as fireproof construction is concerned.

Perfectly fireproof and not affected by continuous moisture, frost, or subject to deterioration by the elements in any way, it is obvious that Asbestos Building Lumber may be employed freely and confidently in a vast variety of places where ordinary wooden lumber has failed.

Primarily designed to replace the ordinary roof coverings only, its merits have been found to be so supreme that its employment by our best architects and engineers has extended to all classes of light constructive work wherein its many desirable qualities have supplanted other materials heretofore commonly in use.

THE  
CHARACTER  
OF THE  
ASBESTOS-CEMENT MATERIAL

It is perhaps superfluous to an educated person to say to him that Asbestos-Cement Shingles, Slates or Sheathing, made wholly of mineral fibre Asbestos and hydraulic Cement, are both fireproof and indestructible.

**Fireproof and Everlasting**

Both Asbestos, or mineral flax as it is often called, from its peculiarity of crystallizing in fibres instead of in ordinary crystals, as is the usual case with mineral substances, and hydraulic Cement have been known from the earliest times as among the most refractory of substances. The old Greek and Roman remnants of antiquity, composed largely of hydraulic Cement, remain mute witnesses of this everlasting quality in this material. Asbestos fibre has remained exposed to the elements for unnumbered centuries without deterioration, while its well known fireproof quality renders it the most suitable fibre upon which to agglutinate the Cement deposited thereon in the course of manufacture. It is therefore evident, from the well-known natural qualities of these two materials, that nothing could have been selected that would have been more fireproof, indestructible or everlasting than Asbestos fibre and hydraulic Cement as raw materials from which to prepare a permanent building material such as we have in

**ASBESTOS  
CEMENT SHEATHING  
OR  
ASBESTOS  
BUILDING LUMBER**

**Marvelous Toughness and Elasticity**

The Asbestos Building Lumber, composed of such a large percentage of Asbestos fibre, is naturally a tough material, not only for special work, but for ordinary building uses as well. Nails may be driven through it, by a quick sharp blow of the hammer, quite close to the edge without danger of fracture. Asbestos Building Lumber thus differing materially from all other sheathing materials in this important attribute of toughness and homogeneousness.

It is sufficiently elastic to allow of marked tension due to vibration, expansion and contraction of surrounding parts, wind pressure, etc., without cracking or breaking in any manner. The resistance of the Asbestos Building Lumber to blows, flexion, tension, etc., is enormous and surprising. Large pieces of the lumber have sufficient elasticity to allow of being bent around slight curves without splitting, which in many instances is exceedingly desirable. Moreover it may be punched, filed or worked generally with the greatest ease, with ordinary machinery such as is used for working iron, as it is somewhat difficult to work with ordinary wood-working tools, particularly if the Asbestos Building Lumber has been made some time, when it becomes very hard, particularly if

**SELLING AGENTS**  
**IN ALL THE PRINCIPAL CITIES THROUGHOUT THE WORLD**

---

value, is oftentimes exceedingly desirable, as by the use of small beams, or angle iron, or studding, or even ordinary common board partitions between rooms, faced upon both sides with  $\frac{1}{4}$ -inch Asbestos Building Lumber, a thin, strong, slow burning construction or semi-fireproof separation is made that is very saving of space. Partitions of light wooden studding faced with Asbestos Building Lumber upon both sides are likewise of most excellent construction as a fire stop, particularly when 85 per cent. Magnesia Blocks or Asbestos Felts are placed between the studs, making the partition not only a non-conductor of sound, but rendering it almost impossible for any ordinary fire to pass beyond such a barrier.

**Its Insulating Qualities When Compacted Into  
Very Dense Sheets for Roofing**

Asbestos Building Lumber has high insulating qualities in several particulars. As an insulator of heat and cold it is efficient to a high degree. It is much lighter in weight than similar materials, hence it is very superior to them; a roof, for instance, composed of Asbestos-Cement Shingles or Sheathing being much cooler in summer and warmer in winter than natural slate, while in fireproof quality and resistance to natural destructive changes, Asbestos-Cement Shingles are *immeasurably superior to any natural slate ever quarried.*

**Electrical Uses**

In the electrical field Asbestos Building Lumber is utilized advantageously and to a very considerable extent, particularly for compartment doors around power houses,

SELLING AGENTS  
IN ALL THE PRINCIPAL CITIES THROUGHOUT THE WORLD

sub-stations, etc. It provides a most excellent and safe lining beneath and around electric cars, affording protection to the car bodies as well as to the occupants in case of sudden overload and short-circuiting in the motors or connections.

It affords a safeguard against fires from electric wires; can be used for arc deflectors, division plates and barriers in positions where an electric arc is liable to form with resultant damage. It is adaptable for lining of conduits, fire boxes and many of the various safety devices. Manufacturers of electric flat-irons and heating devices find it an indispensable material for use in connection with their products. The valuable properties possessed by Asbestos Building Lumber are rapidly becoming recognized, resulting in a large and steadily increasing demand.

OR  
ASBESTOS  
BUILDING LUMBER

**Asbestos Building Lumber Applied to Ceilings**

Side walls and ceilings may be covered in many designs, either ornamental or plain, with Asbestos Building Lumber, which can be attached to studding, joists, rough sheathing, or in cases where it is not found desirable to remove the plaster the Asbestos Building Lumber can be readily fastened to it by using flat-headed nails of sufficient length to go through plaster, lath and the Asbestos Building Lumber. Walls or ceilings finished in this manner will be found to be a great safeguard against the spread of fire. It is easily cleaned with soap and water, does not discolor with age, and can be ornamented by painting, if so desired, after first applying a coat of filler, as its smooth surface is well adapted to painting or decoration of any kind.

ASBESTOS  
CORRUGATED SHEATHING  
(Patented)

Employed for Roofing, Siding, Awnings, etc.

For Elevators, Train Sheds, Rolling

Mills, Warehouses, etc.

Where Fire Protection is desired

Does Not Rust. Indestructible. Never Requires Paint. Standard Size ( $\frac{1}{8}$  in. thickness) x 27  $\frac{1}{2}$  in. wide. Standard Lengths, 4, 5, 6, 7, 8 and 10 ft. Corrugations 2  $\frac{1}{2}$  in. Pitch.

ASBESTOS CORRUGATED SHEATHING is applied in the same general manner as Corrugated Iron, either laid directly upon the purlins in roof construction and held in place by means of clips or hoop iron wire, or other approved fastening which engages the purlin and are placed in distances of about 12 inches apart, or they can be nailed to wood nailing strips that are bolted to the purlins.

For roofing, two corrugations should be allowed for the lap in the width of the sheet and 6 inches in the length, for the usual pitch of roof of two to one.

On siding, a four-inch to six-inch end lap is sufficient, but on roofing, it requires a lap of six inches, according to the pitch of the roof, in order to more perfectly shed the water in the case of violent storms.

**SELLING AGENTS  
IN ALL THE PRINCIPAL CITIES THROUGHOUT THE WORLD**

For *roofing*, the 2½-inch corrugated sheets will lay 22½ inches wide, with a side lap of two corrugations, or for *siding*, they will lay 25 inches wide, with a side lap of one corrugation, but the sales measurement is 27½ inches in width.

The corrugates are made one at a time by presses of unique design, thereby insuring corrugations that are perfect. We guarantee them to fit perfectly.

**PRICE PER SQUARE FOOT—F.O.B. WORKS**

2½ inch Corrugations ..... .18

Broken lots, boxing extra ; carload lots shipped in bulk ; odd lengths cut to order, for which a cutting charge is made, based upon the actual time consumed in cutting. Standard sized sheets are invariably charged for.

Asbestos Corrugated Sheathing applied on Steel Construction at the plant of the Shenango Furnace Co., Sharpsville, Pa.

SELLING AGENTS  
IN ALL THE PRINCIPAL CITIES THROUGHOUT THE WORLD

## ASBESTOS CORRUGATED SHEATHING

(Patented)

When necessary we can cut sheets in the middle and give two half sheets of any of the standard lengths. When we cut to odd inches, say 7' 9", we charge for an 8' sheet.

As no allowance is made for laps, the following table gives the approximate number of feet necessary to cover one "square." This table is based on using 96-inch sheets. If longer or shorter sheets are used the number of square feet necessary to cover one square (100 square feet finished) will vary slightly.

End laps	1-in.	2-in.	3-in.	4-in.	5-in.	6-in.
	Sq. ft.	Sq. ft.	Sq. ft.	Sq. ft.	Sq. ft.	Sq. ft.
Side lap, 1 corrugation	111	112	113	115	116	117
Side lap, 2 corrugations	124	125	126	128	129	130

 Unless otherwise ordered, we ship the standard 8-foot sheets, basing calculations on 2 corrugations side lap, and 6" end lap.

We never specify Asbestos Corrugated Sheathing to be applied for *roofing* otherwise than with *two corrugations for the side lap* and 6" for the end lap and for siding with two corrugations side lap and with 4" end lap unless the side lap is bolted between supports, in which case one corrugation side lap is sufficient.

Approximate shipping weights per square (not including weight of casing for less than carload orders).

End lap	1-in.	2-in.	3-in.	4-in.	5-in.	6-in.
	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.
Side lap, 1 corrugation	234	236	238	242	244	246
Side lap, 2 corrugations	261	263	265	269	271	273

Write us for information in detail regarding the application of the corrugated sheathing.

 Always drive the nails or bolts, etc., through the ridges (never in the valleys) and thus avoid leaks. Bolt holes should be tapped or pierced.

## ASBESTOS-CEMENT SHINGLES

vs.

## NATURAL SLATES

In natural slates the Asbestos-Cement Shingles have no opposition or competition, since these Asbestos Shingles or Slates are so immeasurably superior in point of practical merit to that of any natural slating material that nothing remains to be said.

Asbestos-Cement Shingles do not change color upon exposure to the weather in any climate. They are fire-proof and unalterable; do not readily crack or exfoliate when exposed to fire, as natural slates do. Even if the snow should drive under them in winter, thaw under the rays of the midday sun, and freeze as night comes on, it would not in any manner deteriorate the Asbestos-Cement Shingles, as they are sufficiently elastic to prevent any cracking or splitting up to the nail hole under such circumstances, as is well known to be the case with the natural roofing slates, thus demonstrating in a striking manner their great superiority over the natural slates.

The Asbestos-Cement Shingles withstand all climates and extremes of weather, as, owing to their natural insulating properties, they are but slowly affected by change of temperature. They may be frozen and thawed, and re-frozen and re-thawed any number of times; they may be burned or otherwise subjected to the most extreme variation of temperature, and will be found intact at the end of the test.

Owing to the enormous pressure under which the Asbestos-Cement Shingles are manufactured, they absorb, when fresh, only about one-tenth of their weight of water, thus forming, as will be seen, a roofing tile or

**SELLING AGENTS  
IN ALL THE PRINCIPAL CITIES THROUGHOUT THE WORLD**

plate of most excellent quality. Exposed to the action of the atmosphere for a year or more, the hydration and subsequent hardening which takes place converts them into absolutely impermeable roof coverings, which as such defy all changes of climate, and they thus become greatly superior to most other forms of sheathing.

### **Economy**

On account of the lightness of weight of the Asbestos-Cement Shingles, the framing may be of very much lighter construction than that designed to carry roofs of natural slate, hence a very considerable sum is saved in building construction upon this very account; the Asbestos Shingles may be cut or sawed, shaped to fit around dormer windows, chimneys, etc., etc., without fear of injury to those surrounding them. Owing to our perforation of the tips of those shingles which are designed to be laid in the diagonal or "French" style, the alignment is greatly facilitated, in fact, made perfect, and the work of laying rendered less laborious and costly. When with these good features is combined the absolute unalterability of the Asbestos-Cement Shingles, their economy of application and maintenance, their fireproof qualities, their toughness and elasticity, it is not to be wondered at that they defy all competition as to quality, with other materials heretofore employed for the covering of buildings.

### **ASBESTOS-CEMENT SHINGLES**

Asbestos-Cement Shingles are so called because of the fact that, being made of Asbestos and Cement, they are absolutely indestructible by the elements; they are tough and elastic; they can be put upon an ordinary

SELLING AGENTS  
IN ALL THE PRINCIPAL CITIES THROUGHOUT THE WORLD

roughly sheathed roof, and the telephone and electric linemen can tramp all over it without injuring the Asbestos-Cement Shingles, which it is well known they cannot do in the case of ordinary natural slates. Asbestos-Cement Shingles, which are sold in Europe to an enormous extent under the name of "Eternit Slates," stand to-day unapproached in the line of roof coverings by any other material. Ordinary cedar, cypress or redwood shingles have, at best, only an ephemeral life, and at the seashore the usual process of decay sets in with the most startling rapidity, on account of their becoming saturated with the saline air, in consequence of the hygroscopic character of which they remain continuously damp, and hence decay sets in at the earliest moment and proceeds with the greatest rapidity. In contradistinction to this, Asbestos-Cement Shingles being composed of those two indestructible materials, Asbestos and Cement, may be exposed to the action of sea air or sea water without even undergoing the slightest deterioration or change. Upon this account Asbestos-Cement Shingles are by far the cheapest roof covering material which can be used for seashore resorts or detached cottages exposed to sea air. Asbestos-Cement Shingles are fireproof to a remarkable degree, and in case of fire greatly aid in confining the fire to the building in which it originates, instead of, as in the case of wooden shingles, becoming like so many firebrands or fire-winged birds, blazing and carrying aloft the dreaded fire banners to create other conflagrations within a wide circle from the source of the original fire. The Asbestos-Cement Shingles by a recently patented device may be so bound together at the tips thereof by copper "Storm" nails or "hurricane fastenings" that,

SELLING AGENTS  
IN ALL THE PRINCIPAL CITIES THROUGHOUT THE WORLD

---

when laid diagonally, after the "French" method, the roof thus protected will not only remain intact until the supporting timbers are burned through, but by being so bound together there is no opportunity for a break and the roof instead of being a great menace to the neighborhood becomes a great source of protection, and often is successful in confining the fire absolutely to the building in which it has originated without menace to the surrounding property.

On seashore cottages particularly, these Asbestos-Cement Shingles may be used as a general sheathing, and make a permanent, indestructible protection against the elements. They may be painted if desired, but it is altogether unnecessary, unless it may from time to time be desired to change the natural color of the shingles.

Nos. 19, 24 and 29 (see page 54), employed as a band course to break the straight and even lines when laying any of the straight "butt" shingles according to the American method. This style or shaped shingle is also frequently employed for siding.

SELLING AGENTS  
IN ALL THE PRINCIPAL CITIES THROUGHOUT THE WORLD

### French or Russian Method of Roofing

The "French" method of applying Asbestos-Cement Shingles or Roofing Slates has many advantages over any other usage. Among the advantages of this method are the reduced cost of both the amount of material and its application, the reduced weight of the completed roof and the variety and beauty of design which may be thus secured. After very careful observation in this and several European countries, we have become so thoroughly convinced of the value of this method of application, that we without hesitancy recommend it to all who desire a handsome and serviceable roof covering at a moderate cost. This "French" or diagonal method of application can be used upon nearly every class of structure where there is sufficient pitch of roof for the ordinary use of wooden shingles or natural slates. By this method of application the nails used in one shingle are entirely independent of any other shingle, thus allowing for expansion or contraction, without placing an unusual strain on either the fastenings or the shingles. No matter under what atmospheric conditions they may be applied, heat or cold, wet or dry, the Asbestos-Cement Shingles stand to-day unapproached in the line of roof coverings by any other material. For directions for laying according to the "French" or Russian method see pages 27, 30, 32, 33, 36 and 37.

Shipped in cases only, for which a small additional boxing charge is made.

Illustrations showing the proper use of the copper "Storm" nail or clincher used in laying the shingles in accordance with the "French" method

Note that the copper "Storm" nail is placed in position (see figures Nos. 1 and 2 in the illustration above) by resting the large head on the shingle underneath (first course below) and pushed halfway underneath the shingle immediately above (see the position of the copper "Storm" nail or clincher as now shown in the illustration below). The next shingle in the same course is then [See opposite page.]

The shingles marked Nos. 1 and 2 in this illustration are the same as those having the same numbers in the illustration at the top of this page and the following page.

**Illustrations showing the proper use of the copper "Storm" nail or clincher used in laying the shingles in accordance with the "French" method**

placed in position (see the right-hand shingle marked No. 2 in the illustration above). Each course is finished in this way.

In putting on the next course above (see the shingle marked No. 3 in the illustration below) the shingle marked No. 3 is put over the copper "Storm" nail, the shank of which will protrude through the hole punched in the lower point of the shingle marked No. 3 and is then bent downward (see the lower right-hand arrow in the illustration below). Another "Storm" nail is then placed in position at the cut or abutting sides as described and illustrated on the previous page as shown at No. 2.

Note that *all* the arrows point to the copper "Storm" nails.

OR

## ASBESTOS ROOFING SLATES

Waterproof      Everlasting      Fireproof

American Type of Roofing

Illustrating the American Method of Application employing

### Asbestos-Cement Shingles

Shingles of any of the following numbers can be laid or used in a like manner: viz. Nos. 2, 7 and 12; 1, 6, 11 and 14, or any of the other ones illustrated in this catalogue excepting the Nos. 3, 8 and 13, and Nos. 65, 66 and 67 shingles, which are used for the French method of application only.

All tables presented in this catalogue giving the number of shingles or slates and the approximate weight per square, are based on *each slate overlapping the slate in the second course below two inches* with the exception of shingles Nos. 33, 38 and 43, 34, 39 and 44, which are laid with each shingle or slate overlapping the shingle in the second course *below three or more inches*.

We do not recommend the use of Asbestos-Cement Shingles or Roofing Slates on roofs that have a rise of less than four inches to the foot, although we have them in successful use on many roofs where the pitch is considerably less.

### Asbestos-Cement Shingles

Nos. 16, 21 and 26 and any of the other sizes of shingles illustrated in this list, except Nos. 3, 8 and 13 and 65, 66 and 67, can be laid or used in a like manner.

All tables covering shingles intended to be laid according to the American method presented in this catalogue, *except where specifically stated*, giving the number of shingles or slates, and the approximate weight per square, *are based on each slate overlapping the slate in the second course below two inches.*

---

Architect's specifications for the application of Asbestos-Cement Shingles or Asbestos Roofing Slates, to be applied after the American method, should read exactly the same as for natural slate except that a 2" head-lap should be specified instead of the usual head-lap employed for natural slate, except certain shapes which specifically call for a 3" or larger head-lap.

---

Various patterns or designs made by employing two or more  
styles of American method Asbestos Shingles  
or Roofing Slates.

This illustration shows Nos. 49, 54, 59 (see page 61) and 53, 58 and 63 (see page 56), employed as band courses to break the straight and even lines when laying any of the straight "butt" shingles according to the American method.

Nos. 72, 77 and 82 (priced on page 58), employed as a band course to break the straight and even lines when laid according to the American method. This style or shaped shingle is frequently used for siding, especially in the gables, etc.

When Nos. 70, 75 and 80 are laid according to the American method with a two-inch head-lap over the head of the second course below we have a true hexagonal effect. This style or shingled shingle is applied in many sections for siding as well as roofing and gives a very pleasing "honeycomb" appearance.

First Presbyterian Church of Pittsburg, Kan., roofed with No. 8 Asphalt-Cement Shingles laid according to the "French" method.

See pages 27-28 for specifications for the application of Asbestos Shingles after the regular "French" method.

See pages 36-37 illustrating how the copper "Storm" nail is used with the "French" method.

See page 32 for different methods of "starting" to lay Asbestos Shingles.
